We have provided this low-resolution, digitized version for research purposes. To inquire about publishing any images from this item, please contact the Institute.

*About the Institute*

The Hunt Institute for Botanical Documentation, a research division of Carnegie Mellon University, specializes in the history of botany and all aspects of plant science and serves the international scientific community through research and documentation. To this end, the Institute acquires and maintains authoritative collections of books, plant images, manuscripts, portraits and data files, and provides publications and other modes of information service. The Institute meets the reference needs of botanists, biologists, historians, conservationists, librarians, bibliographers and the public at large, especially those concerned with any aspect of the North American flora.

Hunt Institute was dedicated in 1961 as the Rachel McMasters Miller Hunt Botanical Library, an international center for bibliographical research and service in the interests of botany and horticulture, as well as a center for the study of all aspects of the history of the plant sciences. By 1971 the Library's activities had so diversified that the name was changed to Hunt Institute for Botanical Documentation. Growth in collections and research projects led to the establishment of four programmatic departments: Archives, Art, Bibliography and the Library.

THE

ROYAL

# Chain Pier Bazaar.

This Establishment has just received a large importation of the

## VEGETABLE IVORY,

OR,

## NUTS OF THE IVORY TREE.

This extraordinary Nut, from which they manufacture fancy articles of all kinds, for purity of color and hardness, quite supersedes the Elephant Ivory.

This singular Nut, from the solidity it acquires at a certain age, is rendered an object of peculiar interest and amusement to those who contemplate the wonderful economy of the Vegetable World. Its shell or outer covering is barely so thick as that of the common hazel, and yet is so extremely hard that no instrument will make an impression on it: it can only be removed from the kernel by pressure. Bears and other animals eat the Nut with avidity ere it has acquired its solid state, and derive considerable nourishment therefrom. The learned Dr. Lindley classes the tree among the family of Palms; and it is common in the Mascaren Islands, where it is called the Tagua Plant. Persoon describes the Nut and its shell as being enclosed in a prickly head, or *drupe*. The kernel, in an early state, includes a limpid liquor, which becomes milky and sweet, and at length acquires the solidity of Ivory.

The Indians cover their cottages with the largest leaves; and the shavings of this Nut, when boiled, afford a milky liquor, highly nutritious, and not at all gelatinous, as the shavings or dust of Ivory is known to be, when boiled down.
